

RWorksheet_#6

Charles Huervana BSIT 2-C

2023-12-21

1. Create a data frame for the table below. Show your solution.
 - a. Compute the descriptive statistics using different packages (Hmisc and pastecs). Write the codes and its result.

```
StudentScore <- data.frame(Student = c(1,2,3,4,5,6,7,8,9,10),
                             PreTest = c(55,54,47,57,51,61,57,54,63,58),
                             PostTest = c(61,60,56,63,56,63,59,56,62,61))
```

StudentScore

```
##      Student PreTest PostTest
## 1         1      55       61
## 2         2      54       60
## 3         3      47       56
## 4         4      57       63
## 5         5      51       56
## 6         6      61       63
## 7         7      57       59
## 8         8      54       56
## 9         9      63       62
## 10        10      58       61
```

```
install.packages("htmltools")
```

```
## Installing package into '/cloud/lib/x86_64-pc-linux-gnu-library/4.3'
## (as 'lib' is unspecified)
```

```

```

2. The Department of Agriculture was studying the effects of several levels of a fertilizer on the growth of a plant. For some analyses, it might be useful to convert the fertilizer levels to an ordered factor.

```
library(dplyr)
```

```
##
## Attaching package: 'dplyr'
##
## The following objects are masked from 'package:stats':
##
##      first, last
##
## The following objects are masked from 'package:Hmisc':
##
##      src, summarize
##
## The following objects are masked from 'package:base':
##
##      filter, lag
```

```
## The following objects are masked from 'package:base':
##
## intersect, setdiff, setequal, union
```

```
fertLev <- c(10,10,10, 20,20,50,10,20,10,50,20,50,20,10)

orderedFactor <- factor(fertLev, levels = unique(fertLev))

basicStats <- summary(orderedFactor)
basicStats
```

```
## 10 20 50
## 6 5 3
```

3. Abdul Hassan, president of Floor Coverings Unlimited, has asked you to study the exercise levels undertaken by 10 subjects were “l”, “n”, “n”, “i”, “l”, “l”, “n”,

“n”, “i”, “l” ; n=none, l=light, i=intense a. What is the best way to represent this in R?

```
exercise_levels <- c("l", "n", "n", "i", "l", "l", "n", "n", "i", "l")

exerciseFactor <- factor(exercise_levels, levels = c("n", "l", "i"), labels = c("none", "light", "intense"))

exerciseFactor

## [1] light none none intense light light none none intense
## [10] light
## Levels: none light intense
```

4. Sample of 30 tax accountants from all the states and territories of Australia and their individual state of origin is specified by a character vector of state mnemonics as: state <- c(“tas”, “sa”, “qld”, “nsw”, “nsw”, “nt”, “wa”, “wa”, “qld”, “vic”, “nsw”, “vic”, “qld”, “qld”, “sa”, “tas”, “sa”, “nt”, “wa”, “vic”, “qld”, “nsw”, “nsw”, “wa”, “sa”, “act”, “nsw”, “vic”, “vic”, “act”)

- a. Apply the factor function and factor level. Describe the results.

```
state <- c("tas", "sa", "qld", "nsw", "nsw", "nt", "wa", "wa", "qld",
          "vic", "nsw", "vic", "qld", "qld", "sa", "tas", "sa", "nt",
          "wa", "vic", "qld", "nsw", "nsw", "wa", "sa", "act", "nsw",
          "vic", "vic", "act")

stateFactor <- factor(state, levels = c("act", "nsw", "nt", "qld", "sa", "tas", "vic", "wa"))

stateFactor

## [1] tas sa qld nsw nsw nt wa wa qld vic nsw vic qld qld sa tas sa nt wa
## [20] vic qld nsw nsw wa sa act nsw vic vic act
## Levels: act nsw nt qld sa tas vic wa
```

5. From #4 - continuation: • Suppose we have the incomes of the same tax accountants in another vector (in suitably large units of money) incomes <- c(60, 49, 40, 61, 64, 60, 59, 54, 62, 69, 70, 42, 56, 61, 61, 61, 58, 51, 48, 65, 49, 49, 41, 48, 52, 46, 59, 46, 58, 43)

- a. Calculate the sample mean income for each state we can now use the special function tapply():

```

incomes <- c(60, 49, 40, 61, 64, 60, 59, 54, 62, 69, 70, 42, 56, 61, 61, 61, 58, 51, 48, 65, 49, 49, 41)

stateFactor <- factor(state, levels = c("act", "nsw", "nt", "qld", "sa", "tas", "vic", "wa"))

incMeans <- tapply(incomes, stateFactor, mean)

incMeans

##      act      nsw      nt      qld      sa      tas      vic      wa
## 44.50000 57.33333 55.50000 53.60000 55.00000 60.50000 56.00000 52.25000

```

b. Copy the results and interpret.

```

# act      nsw      nt      qld      sa      tas      vic      wa
# 44.50000 57.33333 55.50000 53.60000 55.00000 60.50000 56.00000 52.25000

#These results provide an average income for tax accountants in each state based on the provided data.

```

6. Calculate the standard errors of the state income means (refer again to number 3) `stdError <- function(x) sqrt(var(x)/length(x))`

a. What is the standard error? Write the codes.

```

stdError <- function(x) sqrt(var(x)/length(x))
incster <- tapply(incomes, state, stdError)
standardError <- tapply(incomes, stateFactor, stdError)
standardError

```

```

##      act      nsw      nt      qld      sa      tas      vic      wa
## 1.500000 4.310195 4.500000 4.106093 2.738613 0.500000 5.244044 2.657536

```

b. Interpret the results.

```

#In summary, standard deviations provide a measure of the spread or variability of incomes within each

```

7. Use the titanic dataset.

a. subset the titanic dataset of those who survived and not survived. Show the codes and its result.

```

library(titanic)

data("titanic_train")
titanic_data <- titanic_train

str(titanic_data)

## 'data.frame':   891 obs. of  12 variables:
##  $ PassengerId: int  1 2 3 4 5 6 7 8 9 10 ...
